

Product Specification Sheet

Product Name	pLenti-CMV-Luciferase-EF1-GFP-T2A-PURO Lentiviral Reporter Vector
Description	<p>Lentivirus vector based on the human immunodeficiency virus-1 (HIV-1) has become a promising vector for gene transfer studies. Lentiviral vectors packaged as lentiviral particles is one of the most efficient tools to deliver exogenous genes into virtually any types of mammalian cells both in vitro and in vivo. The advantageous feature of lentivirus vector is the ability of gene transfer and integration into dividing and non-dividing cells, with low immune response and toxicity in vivo. These viruses also integrate stably into the host genome, enabling long-term transgene expression. Our 3rd generation lentiviral systems have been designed for increased researcher safety.</p> <p>pLenti-CMV-Luciferase-EF1-GFP-T2A-PURO Lentiviral Reporter Vector contains the multiple cloning sites (MCS), Luciferase reporter is driven by CMV promoter. coGFP and Puromycin are driven by EF1α promoter. The multiple restriction enzyme sites are included for convenient cloning of your gene of interest.</p>
Catalog Number	LR153
Size	10 μ g at 0.5 μ g/ μ L in TE
Shipping	Room temperature
Storage and Stability	Store at -20°C immediately upon receipt. This product is stable for 6 months when stored as directed.
Quality Control	This plasmid is sequence verified.
Safety Precaution	Remember that you will be working with samples containing infectious virus. Follow the recommended NIH guidelines for all materials containing BSL-2 organisms. The ALSTEM Lentiviral Expression System is designed to minimize the chance of generating replication-competent lentivirus, but precautions should still be taken to avoid direct contact with viral supernatants.
Restricted Use	For Research Use Only. Not for use in diagnostic or therapeutic procedures.

Vector Information

This lentiviral reporter vector that contains all elements for efficient and high yield viral production. Firefly Luciferase reporter is driven by CMV promoter. GFP and Puromycin are driven by EF1 α promoter. The multiple restriction enzyme sites are included for convenient cloning of your gene of interest.

Created with SnapGene®

*Note: Bacterial culture of pLenti vectors should be done in medium containing **50 $\mu\text{g/mL}$ Ampicillin**. For maximal plasmid yield and quality, we recommend *Stbl3* competent cells (Invitrogen).*

IMPORTANT NOTICE

Store the vial at -20°C immediately upon receipt.
